## Group A

# **Assignment No: 3**

**Title of the Assignment:** Implement Min, Max, Sum and Average operations using Parallel Reduction.

**Objective of the Assignment:** To understand the concept of parallel reduction and how it can be used to perform basic mathematical operations on given data sets.

## **Prerequisite:**

- 1. Parallel computing architectures
- 2. Parallel programming models
- 3. Proficiency in programming languages

## **Contents for Theory:**

- 1. What is parallel reduction and its usefulness for mathematical operations on large data?
- Concept of OpenMP
- 3. How do parallel reduction algorithms for Min, Max, Sum, and Average work, and what are their advantages and limitations?

------

SITRC,Nashik 1

#### **Parallel Reduction.**

Here's a **function-wise manual** on how to understand and run the sample C++ program that demonstrates how to implement Min, Max, Sum, and Average operations using parallel reduction.

#### 1. Min\_Reduction function

• The function takes in a vector of integers as input and finds the minimum value in the vector using parallel reduction.

Course: Laboratory Practice V

- The OpenMP reduction clause is used with the "min" operator to find the minimum value across all threads.
- The minimum value found by each thread is reduced to the overall minimum value of the entire array.
- The final minimum value is printed to the console.

#### 2. Max Reduction function

- The function takes in a vector of integers as input and finds the maximum value in the vector using parallel reduction.
- The OpenMP reduction clause is used with the "max" operator to find the maximum value across all threads.
- The maximum value found by each thread is reduced to the overall maximum value of the entire array.
- The final maximum value is printed to the console.

#### 3. Sum\_Reduction function

- The function takes in a vector of integers as input and finds the sum of all the values in the vector using parallel reduction.
- The OpenMP reduction clause is used with the "+" operator to find the sum across all threads.
- The sum found by each thread is reduced to the overall sum of the entire array.
- The final sum is printed to the console.

#### 4. Average\_Reduction function

- The function takes in a vector of integers as input and finds the average of all the values in the vector using parallel reduction.
- The OpenMP reduction clause is used with the "+" operator to find the sum across all threads.

SITRC,Nashik 2

- The sum found by each thread is reduced to the overall sum of the entire array.
- The final sum is divided by the size of the array to find the average.
- The final average value is printed to the console.

#### 5. Main Function

- The function initializes a vector of integers with some values.
- The function calls the min\_reduction, max\_reduction, sum\_reduction, and average\_reduction functions on the input vector to find the corresponding values.

Course: Laboratory Practice V

• The final minimum, maximum, sum, and average values are printed to the console.

## **6.** Compiling and running the program

**Compile the program:** You need to use a C++ compiler that supports OpenMP, such as g++ or clang. Open a terminal and navigate to the directory where your program is saved. Then, compile the program using the following command:

#### \$ g++ -fopenmp program.cpp -o program

This command compiles your program and creates an executable file named "program". The "-fopenmp" flag tells the compiler to enable OpenMP.

**Run the program:** To run the program, simply type the name of the executable file in the terminal and press Enter:

#### \$ ./program

**Conclusion:** We have implemented the Min, Max, Sum, and Average operations using parallel reduction in C++ with OpenMP. Parallel reduction is a powerful technique that allows us to perform these operations on large arrays more efficiently by dividing the work among multiple threads running in parallel. We presented a code example that demonstrates the implementation of these operations using parallel reduction in C++ with OpenMP. We also provided a manual for running OpenMP programs on the Ubuntu platform.

#### **Assignment Question**

- 1. What are the benefits of using parallel reduction for basic operations on large arrays?
- 2. How does OpenMP's "reduction" clause work in parallel reduction?
- 3. How do you set up a C++ program for parallel computation with OpenMP?
- 4. What are the performance characteristics of parallel reduction, and how do they vary based on input size?
- 5. How can you modify the provided code example for more complex operations using parallel reduction?
